# Plant guide

1

Find a pot with drainage and fill with potting soil.

2

Plant your pencil at a 30° angle, covering the seed capsule with soil.

3

Water regularly and in 1-4 weeks, your plants will sprout.

## SEEDS

| Common name                             |                                                                                     | Latin name         | Germination time | Difficulty | Climate                                   | Growing tips                                                                                                   |
|-----------------------------------------|-------------------------------------------------------------------------------------|--------------------|------------------|------------|-------------------------------------------|----------------------------------------------------------------------------------------------------------------|
